

SecureScan Audit Report

Automated Vulnerability Scan, AI Severity Classification & Remediation Guidance

Target Host:	crunchyroll.com
Scan Type:	Full Scan
Execution Time:	2026-05-21 13:36:05 UTC
Open Ports Found:	2
Calculated Threat Score:	15.0 / 100
AI Severity Prediction:	Low (86.8% confidence)

WARNING: This document contains classified security scanning results regarding the analyzed network endpoint target. Leakage of this data can present severe exposure of network vulnerabilities to malicious actors. Keep encrypted and limit distribution to authorized system administrators only.

Executive Security Summary

An automated cyber security scanning audit was successfully executed against target host **crunchyroll.com**. The assessment scanned ports, services, and exposure architectures. A custom mathematical risk analysis, layered with a Supervised Random Forest Classifier Model, was applied to predict the system's absolute vulnerability envelope. Our AI Engine classifies this target as having a **LOW** threat severity profile with an analytical risk score of **15.0/100**.

VULNERABILITY LEVEL: LOWACTION: INFORMATIONAL

Discovered Open Ports & Service Footprints

The following network entry ports were detected in an active open state and exposing transport socket services:

Port	Protocol	Service	Service Version / Banner	Status
80	TCP	http	Cloudflare http proxy	OPEN
443	TCP	http	Cloudflare http proxy	OPEN

Structured Remediation Guidance Plan

Below is a prioritized list of mitigation steps generated by our rule engine and security models. Addressing these items in order of priority will significantly minimize the target's threat envelope.

Host Asset	Priority	Action Plan / Defensive Strategy
Port 80 (http)	HIGH	Enforce SSL/TLS encryption. Redirect unencrypted HTTP traffic on Port 80 to HTTPS (Port 443) and enable HSTS.
Port 443 (http)	LOW	Apply Least-Privileged Access. Ensure service is authenticated and block public access on port 443 if unused.
